# Long-Form Statics Playbook

Oct 5, 2026 · @Sulo

## Section 00 — Why This Format Dominates

Every serious supplement brand running at scale right now is building their acquisition engine around long-form statics. Here's why.

- **Isolates copy from production:** When a video fails you can't diagnose why. When a long-form static fails, the answer is clear — wrong angle or wrong avatar. One variable.
- **Fastest iteration speed:** No editor, no revision cycles, no agency dependency. A skilled operator produces 3 new ads per day — 15 data points per week.
- **Scales hard and runs long:** The algorithm finds people who read the entire thing. Brands report single ads spending $10K–$20K/day for months without fatigue.
- **Top-of-funnel reach:** Catches people before they're in shopping mode. Massive audience pool because you're educating, not selling.
- **The winning static is your creative brief:** Validated copy becomes the script for AI talking head, UGC, VSL, and b-roll mashup — all from one proven asset.

> "A failing long-form static tells you the angle or avatar is wrong. A failing video ad tells you nothing."

## Section 01 — What Is a Long-Form Static

A Facebook/Instagram image ad with 2,000–5,000+ words of primary text copy. The image stops the scroll. The copy does all the selling.

- **Minimum 2,000 words:** Often 3,000–5,000. The length is the feature — it filters serious readers from casual scrollers.
- **Image = hook, copy = conversion:** The image and headline capture attention. Everything after that is pure copy skill.
- **An advertorial brought before the click:** Whatever happens on a traditional advertorial post-click — you bring all of it into the ad itself.
- **Zero assumed interest:** The copy must earn every single line of continued reading from a cold stranger who was scrolling past cat videos 30 seconds ago.
- **Not a longer short ad:** It's a narrative — a story with a specific architecture, a psychological journey, and a specific emotional destination.

# Section 02 — The Three Pillars

Every winning long-form static is built from the intersection of three inputs. Miss any one and the copy will be generic, unbelievable, or structurally weak.

1. **Pillar I — Research:** First-party customer data. Reddit. Amazon reviews. Facebook Groups. Competitor transcripts. The operator who best understands the customer's inner monologue consistently out-converts.
2. **Pillar II — Swipe File:** Proven structural formats from competitor long-form statics. Winning hooks. Anatomized ad breakdowns. You don't write from scratch — you write from proven structures.
3. **Pillar III — Execution:** Daily KPI-driven output. Section-by-section drafting. Immediate launch without overthinking. The system only works if it runs every day.

# Section 03 — Avatar & Research Architecture

Short-form ads require you to understand your avatar. Long-form ads require you to become your avatar for 3,000 words. You need the Wednesday-at-5:45am version of their life — not the marketing version.

## What you need to know before writing one line

- **Daily experience:** Not generic — the specific morning ritual, the alarm they snooze, the coffee they pour into yesterday's mug.
- **Internal monologue:** What they tell themselves: 'I'm just not a morning person.' 'Everyone's tired.' These exact phrases become your ad's vocabulary.
- **Failed attempts:** Every single thing they've tried, in order. The sequence matters — it becomes your failed solutions section.
- **Their language:** Not clinical terms. Their words: 'running on fumes,' 'brain underwater,' 'shell of who I used to be.' Scraped from Amazon reviews, Reddit, Facebook groups.
- **Relationships affected:** Who notices their decline? Who picks up the slack? Who made the comment that stung? Long-form ads live in relationships.
- **The unspoken fear:** The thing they won't say out loud. Missing their kids' childhood. Getting fired. Their marriage falling apart.
- **Urgency trigger:** What event or emotional threshold pushes them from passive sufferer to active solution-seeker?

## Where to find this

- **Reddit:** Search problem keyword → filter by Media → sort by most engaged. Posts written with zero filter = your ad's vocabulary.

- **Amazon reviews:** 1-star reviews expose what failed and why. 5-star reviews describe the transformation in the customer's own words.
- **Facebook groups:** What questions get the most engagement? What fears are voiced? What moment-of-urgency scenarios do people describe?
- **Customer support tickets:** Complaints reveal the real pain. Thank-you emails reveal the real transformation.
- **5 recorded customer conversations:** Worth more than any copywriting course.

### Sub-avatar architecture

Most brands compete at the broad avatar level. The competitive advantage lives at the sub-avatar level.

| Level | Example |
|---|---|
| Broad avatar | 50–70 year-old woman with chronic joint pain |
| Sub-avatar A | Woman, 55–65, morning stiffness upon waking, has tried ibuprofen daily, concerned about long-term kidney impact of NSAIDs |
| Sub-avatar B | Woman, 60–70, hip/knee degradation, comparing natural alternatives to prescription anti-inflammatories |
| Sub-avatar C | Active woman, 50–60, joint pain limiting exercise, motivated by desire to maintain physical independence |

- Each sub-avatar warrants its own long-form static.
- Same product — different hook, different failed solution narrative, different proof sequence.
- This is where the scaling spiral begins.

## Section 04 — Awareness Level Targeting

Eugene Schwartz's awareness continuum determines the entire architecture of your ad — its length, hook style, when the mechanism appears, how the product is introduced.

| Awareness level | What it means and how to write for it | Length |
|---|---|---|
| Unaware | Doesn't know they have a problem. Hook: pure story, no hint of a problem. You need maximum runway. | 700–1,000+ lines |
| Problem-aware | Knows the problem, tried things, nothing worked. Hook: story that signals 'I had your problem.' Sweet spot for most supplement brands. | 500–800 lines |
| Solution-aware | Knows solutions exist, comparing options. Hook: can reference solutions directly. Needs mechanism and proof, not world-building. | 400–600 lines |

- **Testing sequence:** Start with problem-aware and solution-aware hooks — they convert faster and teach you which pain points resonate strongest.
- **Scale unaware angles:** Only after your core messaging is proven.
- **Product-aware audiences:** Don't use long-form. Use testimonials, offers, and short-form. Long-form is education — product-aware people need a reason to act, not education.
- **Why it scales:** Long-form opens new TAM by reaching people before they're in shopping mode. Massive audience pool = ads that run for months.

## Section 05 — The Complete Script Structure

Every effective long-form static follows a layered persuasion architecture. Each section performs a specific psychological function.

1. **Hook / Headline:** First 1–2 lines before 'See more.' Hyperbolic, emotional, contains jeopardy. Stops the scroll AND filters the audience.
2. **Lead (Storyline):** Sets up everything before the mechanism. Contains: storyline, identification, symptoms, fear/worst-case, failed solutions, real-life consequences, core emotion.
3. **Mechanism:** Problem mechanism (why the problem exists, reframed) + solution mechanism (why this product works differently). Must be novel.
4. **Product Intro:** Organic introduction — desperation frame or third-party discovery. Never announced, always a story resolution.
5. **Close:** Differentiation. Social proof stack. Risk reversal. Urgency. Scarcity. CTA. Optional PS/PPS.

# Section 06 — Building Your Mechanism

Every long-form ad that prints money has a mechanism at its core — the "hidden reason" that explains everything. Without it, your ad is a long story that ends with "buy my product."

## What a mechanism does

- Explains WHY the reader has the problem — not just that they have it.
- Explains WHY everything they've tried has failed — with specific, logical reasons.
- Creates a logical bridge to your product — the reader should be able to predict what the solution needs to do.

## How to build it

1. **Root Cause:** Identify the root cause your product addresses that competitors don't. Not a feature — a root cause.
2. **The Cascade:** Build the chain. The root cause causes a chain of problems that feed into each other. Each link = a section of your ad.
3. **Partial Solutions:** Show why each alternative addresses one link in the chain but misses the others. Every partial solution has a specific, logical reason for failing.
4. **Your Solution:** Position your product as the only thing that breaks the full cycle — not because it's 'better' but because it addresses the specific combination of factors nothing else addresses simultaneously.

## The analogy requirement

- Every great mechanism needs at least one analogy that makes it instantly understandable.
- 'Running a car engine with no oil' — why pushing through fatigue without fixing the root cause accelerates damage.
- The analogy is what the reader remembers. It's what they tell their friend. Spend real time finding the right one.

> "The mechanism must be: true (or defensibly true), simple enough to explain over coffee in two minutes, complex enough to feel like a revelation, and unique enough that it logically leads to YOUR product and only your product."

# Section 07 — The Hook: Three Winning Patterns

After auditing thousands of long-form statics, every winning hook uses one of three patterns.

| Tier | Share of winners | How it opens |
|---|---|---|
| Tier 1 — Staged Scene | 70% | Opens with a physical moment. Reader is dropped INTO the scene before any claim is made. Trust before promise. No product. No benefit. Just a moment. |
| Tier 2 — Authority Insider | 15% | Opens with insider credibility. Credential first. Specific number. Specific role. Then the wedge. 'After 18 years as a nephrologist...' |
| Tier 3 — Counter-Frame | 15% | Opens by destroying conventional wisdom. Forces the reader to pause and reconsider. 'If your A1C is sitting at 6.8 and your doctor calls it managed — but your feet still tingle...' |

## Hook rules

- No product. No benefit. No category. If the reader can guess what you're selling from the hook — rewrite it.
- Specific and emotional — not 'I was always tired' but the exact Tuesday morning moment.
- Creates an open loop that can only be closed by reading more.
- Hyperbolic — more dramatic, more jeopardy-laden than you think is appropriate. In a feed full of noise, restraint is invisible.
- Matches the avatar's world — their relationships, their situations, their language.

**Examples:**

> "My husband almost lost his promotion because of me. Not because of something I said. Not because of something I did. But because I didn't go..."

> "I wasn't crazy. I wasn't lazy. I was ill and my GP missed it for 1,127 days."

# Section 08 — The Lead Architecture

The lead is the longest section and the one most people rush through. This is the section that makes people read 3,000 words. They are reading their own story.

## What the lead must contain

- **Storyline:** Without a storyline there is no jeopardy, no sense of payoff, no emotional journey. Not a list of symptoms — a narrative with a before, a decline, and a turning point.
- **Heavy Identification:** Copy that must feel written for ONE person. Pull language directly from reviews, Reddit, forums.
- **Symptoms:** Complete knowledge of all symptoms, how they manifest, in what contexts. Sequenced — each worse than the last.
- **Fear / Worst-Case Scenario:** What happens if nothing changes? Amputation, dialysis, complete immobility, missing your children's childhood. The emotional peak.
- **Failed Solutions (Sequenced):** Name specific products in the order the avatar would actually have tried them. Wrong sequence breaks believability.
- **Real-Life Consequences:** How does this affect marriage, independence, social life, parenting? Stakes must be relational and generational.
- **Core Emotion:** One central feeling driving the entire lead: vindication, loss aversion, betrayal, shame, hope. Every line serves this emotion.

## The inciting incident

- 'I decided to try something new' is NOT an inciting incident.
- 'I felt my eyes close at 45 miles per hour with my children in the backseat' IS.
- Must be visceral, irreversible, and dramatic enough to justify the narrator's entire journey of discovery.

> "Behind every long-form static that converts, there is a core emotion. Vindication — where a sophisticated market has always felt something was being hidden from them. Loss aversion — where the problem has taken something they want back."

# Section 09 — Organic Product Introduction

The product introduction must emerge organically from the storyline — never placed, never announced. If the reader can feel the moment the ad "becomes an ad," you've failed.

### The desperation frame

- **Late-night doom scroll:** Searching for answers at 2am, found a thread or post they almost scrolled past. 'Something made me click.'
- **Accidental conversation:** Stumbled upon someone who knew the solution — a stranger at a doctor's office, a comment in a Facebook group.
- **The obscure source:** Found something in an unexpected place that nobody in mainstream medicine had mentioned.

### The wisdom-of-the-ancients frame

- Solution comes from an ancient, obscure, or culturally remote source the mainstream medical establishment has ignored.
- Variations: Amish community in Pennsylvania, ancient Greek tradition, remote African tribe, herb that only grows in a specific region.
- Guarantees the reader has never heard about this phenomenon before — automatically re-hooks them.
- Explains why their doctor never mentioned it — not incompetence, but a system that only funds what it can patent.

### The tone rule

- The narrator doesn't know marketing language.
- 'It's called Metabolae, three softgels with breakfast' — not 'introducing the breakthrough formula.'
- Stay in story mode all the way through the product reveal. The transition should be invisible.

## Section 10 — The Close & CTA System

By the time the reader reaches the close, they are warm. The close has one job: remove the final objection, which is almost always risk.

- **Risk Reversal:** Guarantee framing that addresses purchase hesitation directly. Match the guarantee timeline to the transformation timeline. '90-day money-back, no questions asked.'
- **Social Proof Stack:** Testimonials that confirm the mechanism and transformation. Specificity converts — numbers, timeframes, named outcomes. 'My GFR went from 46 to 54 in three months' beats 'I felt so much better.'
- **Urgency:** Anchored to the reader's timeline, not artificial pressure. 'Most patients who see real movement commit to at least three months.'

- **Scarcity:** Only use if genuine. Small company, limited supply, verified sourcing. False scarcity destroys trust permanently.
- **CTA:** One clear call to action. Not multiple options. Not ambiguity. Echo the primary desire established in the hook — close the open loop.
- **PS / PPS:** Reinforce the most important proof point or risk reversal. Many readers skip to the end — the PS is their first read.

> "After 3,000 words, the reader knows the benefits. The CTA should remind them what they LOSE by not acting — not what they gain by acting. Loss aversion closes more than benefit stacking."

## Section 11 — Image Strategy

The image is the least important element for converting — but equally important as the headline for capturing initial attention. It must signal the problem or the avatar's current situation. Not the product. Not the result. The problem.

### Finding image ideas

- **Reddit:** Search problem keyword → filter by Media → sort by most engaged. Highest-upvoted images show what visuals resonate most.
- **What to look for:** X-rays, before/after bodies, symptom photos (swelling, rashes, hair loss), prescription bottles, medical devices. Ugly and native.
- **The Ugly Native Rule:** Must look like a real person posted it — not polished, not obviously AI-generated.

### Image generation

- Use a Reddit reference photo as the starting frame in an image generation tool.
- Never generate without a reference — results look overtly AI and are obviously fake.
- Target format: 4:5 or 1:1 (takes up more feed space) or landscape (looks more authentic).

## Section 12 — Formatting Rules

Long-form ads live or die on formatting. A 3,000-word ad that looks like a wall of text gets zero reads. These rules are non-negotiable.

- **One sentence per line:** Not one paragraph per line. One sentence. Sometimes one fragment. The reader's eye needs to move down the screen in a steady rhythm.

- **Blank line every 1–3 lines:** White space makes the ad feel lighter and faster.
- **Short sentences:** Average 5–15 words. Vary the rhythm. Short. Short. Then a slightly longer one. Then short again.
- **Fragments are powerful:** 'Nothing.' 'Four years.' 'A skeleton crew.' These hit hard because they force the reader to pause.
- **No emojis:** This is a story, not a marketing post. Emojis break the spell and remind the reader they're reading an ad.
- **No formatting tricks:** No bold. No caps (except rare emphasis). No asterisks. No brackets. Clean text that looks like a real person typed it.
- **No marketing language:** The narrator doesn't say 'revolutionary formula.' They say 'it's called [product], one capsule before bed.'

## 8 Things That Kill Long-Form Ads

These are the mistakes that take a potentially great long-form ad and make it scroll-past material. Every single one is fixable if you catch it before launch.

1. **Revealing the product too early:** If the reader knows what you're selling before line 300, the spell is broken. They stop reading a story and start evaluating a pitch.
2. **Shallow avatar understanding:** Generic pain points produce generic ads. 'Always tired?' is a Google search, not a story. If your details could apply to anyone, they resonate with no one.
3. **Rushing the mechanism:** 5 lines = doesn't feel important. 50 lines through dialogue, reactions, analogies, and layered revelation = feels like the most important thing the reader has ever learned.
4. **Switching tone at the product reveal:** Lines 1–500 sound like a human telling their story. Then line 501 suddenly sounds like a landing page. The reader feels betrayed.
5. **Overclaiming results:** 'I had unlimited energy in 3 days' — nobody believes this. 'By week 3 I realized I hadn't needed my afternoon coffee in days' — everyone believes this.
6. **Not matching awareness level:** Mechanism-heavy 3,000-word ad for product-aware people = boring. Short testimonial for unaware people = confusing.
7. **No emotional stakes beyond the individual:** The stakes must be relational and generational. 'My mother slept through her own life. I am not going to sleep through mine.'
8. **Weak inciting incident:** 'I decided to try something new' is not an inciting incident. 'I felt my eyes close at 45 mph with my children in the backseat' is.

# Section 14 — The Writing Process

The actual day-by-day workflow for producing a long-form static. Not theory — the process that produces 3 ads per day, every day.

1. **Day 1 — Research (2–4 hrs):** 50+ Amazon reviews. 20+ Reddit threads. 10+ Facebook group posts. Document everything: exact phrases, sequence of things they tried, specific moments, relationships affected, the fear they won't say out loud.
2. **Day 2 — Mechanism + Story Arc (2 hrs):** Define mechanism in 3–4 sentences. Outline the story: narrator, before-life, decline (5–7 specific losses), failed attempts (in order), inciting incident, authority character, product reveal moment, week-by-week results timeline.
3. **Day 3 — Write the Draft (3–4 hrs):** Write fast. Don't edit. Don't second-guess. Write [FILL IN] and move on. Aim for 600–1,000 lines. Focus on two things only: emotion and specificity.
4. **Day 4 — Edit (2–3 hrs):** Pass 1: cut everything that doesn't move the story forward. Pass 2: would a real person say this? Pass 3: read it out loud. Pass 4: check for the 'ad switch' — at what point does it start feeling like an ad?
5. **Day 5 — Test (1 hr):** Read it to someone who matches your avatar. Not a marketer. Not a friend who'll be nice. Someone who actually has the problem. Watch their face. Then launch.

## Daily KPIs

| KPI | Target |
|---|---|
| Output target | 3 new long-form statics per operator per day |
| Launch method | Single CBO campaign — add new ads daily |
| Research block | Minimum 30 min: Reddit, organic social, competitor ad libraries |
| Study block | Minimum 1 competitor static breakdown per day |
| Review cadence | Weekly: identify top performers, diagnose underperformers, plan iterations |

> "3 ads per day × 5 days = 15 data points per week. At this velocity, you identify patterns that no amount of theoretical analysis could reveal."

# Section 15 — Ad Breakdown: Color-Coded

The course breaks down the complete Metabolae / Dr. Thomas Hale long-form static using a color-coded analysis system. Each color represents a specific persuasion element. Study the sequence. Study the transitions. Study how each section earns the next.

| Element | Color | Definition |
|---|---|---|
| Open Loop / Hook | Yellow | The opening statement that creates irresistible curiosity and audience-filters simultaneously. It forces the reader to ask 'what happens next?' without revealing the answer. The hook must contain jeopardy — something at stake — and speak directly to the avatar's current lived experience. It is the only line that competes with everything else in the feed. |
| Identification | Teal | Copy that makes the target reader feel seen — as if the ad was written specifically for them. Identification uses the avatar's exact language, their specific symptoms, their daily rituals, and their inner monologue. When identification works, the reader stops thinking 'this is an ad' and starts thinking 'this person knows my life.' This is the emotional glue that holds the reader through 3,000 words. |
| Product Intro | Orange | The organic introduction of the product into the narrative — never as an announcement, always as a story resolution. The product appears as something the narrator stumbled upon, was shown by a patient, or discovered through research. The transition from story to product must be invisible. If the reader can feel the moment the ad 'becomes an ad,' the product intro has failed. |

| Element | Color | Definition |
| --- | --- | --- |
| Mechanism Problem / Solution | Blue | The scientific or logical explanation of WHY the problem exists (mechanism problem) and WHY this product works differently (mechanism solution). The mechanism is the revelation at the center of the ad — the thing the reader did not know that explains everything. A strong mechanism makes the product feel inevitable: after understanding the root cause, the reader can predict what the solution must do, and your product is the only thing that does it. |
| Failed Solutions | Grey | The sequenced list of everything the narrator tried before the discovery — named products, in the order the avatar actually tried them, each with a specific reason it failed. Every item the reader recognises is a trust deposit: 'I tried that too.' Failed solutions also clear the ground for the mechanism, so by the time the product appears, every alternative she might reach for is already eliminated. If she finishes thinking 'but what about ashwagandha?', you missed one. (Our definition, not from the course screenshots.) |
| Agitation | Red | Copy that amplifies the emotional weight of the problem — not by adding new information, but by making the reader feel the full consequence of inaction. Agitation uses specificity and stakes: relationships affected, independence lost, future feared. It answers the question 'so what?' at the deepest emotional level. The best agitation copy makes the reader feel the problem is more serious, more urgent, and more personal than they had previously admitted to themselves. |

| Element | Color | Definition |
|---|---|---|
| Authority | White | Credibility signals that make the narrator's claims believable and the mechanism trustworthy. Authority can be professional (18 years as a nephrologist), institutional (peer-reviewed research, ADA journals), or social (patient outcomes with specific numbers). Authority is not bragging — it is the reader's permission to believe. Without it, the mechanism is just a claim. With it, the mechanism is a revelation from someone qualified to reveal it. |
| Future Pacing | Purple | Copy that lets the reader see and feel life after the problem is solved — not as a list of benefits, but as specific, sensory moments: the jeans that fit, the full afternoon with her kids, the morning she forgot to check her stomach. It mirrors the losses from the lead and gives each one back. Keep it modest and concrete; small believable moments outsell dramatic transformations. (Our definition, not from the course screenshots.) |
| Risk Reversal | Pink | The guarantee framing that removes the final objection: risk. It moves the cost of being wrong from the reader to the brand. Match the guarantee length to the transformation timeline so she can try it long enough to see results. Deliver it in the narrator's plain voice ('if it doesn't work, they refund you, no questions asked'), not as a legal notice. (Our definition, not from the course screenshots.) |

| Element | Color | Definition |
|---|---|---|
| Urgency | Olive / yellow | A reason to act now rather than later — anchored to the reader's timeline and self-interest, not artificial pressure. The most effective urgency in long-form statics is consequence-based: 'Every quarter you wait, your GFR drops another point.' Or timeline-based: 'Most patients who see real movement commit to at least three months — and the 90-day guarantee means those months cost nothing if the numbers don't move.' Urgency that serves the reader's interest converts better than urgency that serves the advertiser's interest. |
| Scarcity | Red | A genuine supply limitation that creates additional motivation to act immediately. Scarcity only works when it is believable — small company, verified sourcing, limited production runs. False scarcity destroys trust permanently and should never be used. When scarcity is genuine, it adds a final layer of urgency that compounds with the consequence-based urgency already established. The reader who was going to 'think about it' becomes the reader who clicks now. |
| CTA | Mauve | The single clear action the reader should take, with no competing options. It closes the open loop from the hook and echoes the primary desire. After 3,000 words she already knows the benefits, so the CTA leans on loss aversion — what she keeps losing by waiting — rather than restating what she gains. (Our definition, not from the course screenshots.) |

## Section 17 — Iteration & Scaling

A winning long-form static is not a finished asset. It's a confirmed hypothesis. From that confirmation, you extract the winning mechanism and multiply it across formats, angles, and audiences.

## Iteration dimensions

- **Hook Variation:** Rewrite the opening image/copy using a different authority figure, sub-avatar, or angle into the same core problem. Body can remain unchanged. Isolates the hook variable.
- **Image Variation:** Keep copy identical. Change only the image. Tests whether the visual execution is the limiting factor.
- **Avatar Variation:** Shift the entire static toward a different sub-avatar. Same mechanism, same product, new audience identity in hook and lead.
- **POV Variation:** First-person authority → third-person case study → peer-testimonial POV. Different segments respond to different narrative voices.
- **Lead Variation:** Change the emotional entry point while keeping mechanism and close identical. Change narrator relationship, wisdom-of-the-ancients frame, or lead length.

> "One variable per iteration. When you change everything, you learn nothing about what drove the improvement."

## The scaling spiral

1. Scrape 100 high-quality Reddit threads → categorize into archetypes and awareness points.
2. Launch long-form statics to test which archetypes work.
3. Find winning archetypes → find their winning angles.
4. Horizontally scale across 20 different long-form statics and image formats.
5. Take winner LFS ads → turn into AI talking head videos.
6. Once those scale → turn into creator videos.
7. This is how you get to $30K/day and stay there.

## Funnel paths

| Funnel path | Verdict |
|---|---|
| LFS → Short punchy listicle lander → Product page | Most effective. Listicle continues education without repeating it. |
| LFS → Sales page lander → Product page | Works well for high-consideration buyers. |
| LFS → Advertorial → Product page | Too long a journey. Lower conversion rate. |
| LFS → Product page direct | Rarely works. Product page not designed for cold traffic. |

# Section 18 — The Final Check

Run every ad through these questions before spending a dollar. If any answer is no — fix that section first.

- [ ] **Open loop check:** Does the first line create an open loop that's impossible to ignore? If someone could read line 1 and think 'meh' — rewrite it.
- [ ] **No product in first third:** Could someone read the first 100 lines and have NO idea a product is coming? Any hint of selling in the first third breaks the format.
- [ ] **Real narrator voice:** Does the narrator sound like a real person from your target demographic? Or does it sound like a marketer pretending?
- [ ] **Specific enough details:** 'I was tired' is general. 'I fell asleep during my son's baseball game in the third inning' is specific.
- [ ] **Mechanism through dialogue:** Is the mechanism delivered through dialogue, not lecture? If it reads like a blog post — rewrite it as a conversation.
- [ ] **All alternatives eliminated:** Have you eliminated every major alternative the reader has tried? If they finish thinking 'but what about ashwagandha?' — you missed one.
- [ ] **Invisible product reveal:** Does the product reveal feel like a natural story resolution? If there's a noticeable shift from story to sales — rewrite the transition.
- [ ] **Believable results:** Modest, specific, qualified results with emotional moments beat dramatic claims every time.
- [ ] **Loss aversion CTA:** Does the CTA use loss aversion? Remind them what they LOSE by not acting — not what they gain.
- [ ] **Would you keep reading?:** Be honest. If the answer is no at any point — that's where the ad dies for everyone else too.

> "This format is not about clever writing. It's about deep understanding of your avatar, delivered through a story structure that makes 3,000 words feel like 300."

# Section 19 — Swipe File: Brands

A curated swipe file of supplement brands consistently running long-form static ads on Facebook. Use TrendTrack with the 2,000+ word copy filter to find their current active ads. The brand list itself wasn't in the screenshots.

## How to use this swipe file

Each link opens the Facebook Ad Library filtered to that brand's active ads. To isolate long-form statics: click "Filters," set Ad Copy Length to 2,000+ words, and set Media Type to Image. This single filter removes every other ad format and surfaces only long-form

statics currently running.

For each ad you find: identify the hook pattern (staged scene / authority insider / counter-frame), map the awareness level, trace the mechanism structure, and note the image strategy. Document findings in a running swipe file. Brands that appear repeatedly in your TrendTrack searches have found repeatable winners — study those first.

## TrendTrack filters

| Filter | Setting |
| --- | --- |
| Status | Active |
| Days running | 15–60 |
| Media type | Image |
| Language | English |
| Ad copy length | 2,000+ words |
| Impressions | Exclude low impression count |

Use these filters to find current long-form statics from any brand in the list.
